**RESULTS**

78.87% of participants were White, but Blacks are most affected by CHD in LAC.

76.94% of the participants were white, but Whites and Asians are least affected by Type 2 diabetes in LAC.

**Clinical Trials for CHD:**
- 78.87% of participants were White, but Blacks are most affected by CHD in LAC.
  
**Clinical Trials for Type 2 Diabetes:**
- 76.94% of the participants were white, but Whites and Asians are least affected by Type 2 diabetes in LAC.

**CONCLUSIONS**
- Clinical trials lack representation of patient populations.
- Both racial breakdowns of participants are similar for CHD and Type 2 Diabetes although both conditions have different patient populations.
- Participants enrolling in the clinical trials for CHD and Type 2 diabetes reflect the demographics of LAC.
- To ensure accurate reporting of participants, study results in clinical trials should give a breakdown of White participants by ethnicity.
